Dear Sir,

In regards to the Mums I must say that this is the first time that I have received plants as far away as Magnolia, N. J. to Beaumont, Texas, and not even have a wilted leaf among the plants for in the past we have expected to lose one in every five plants. I will not hesitate to recommend your plants both for size and the care that is taken in packing them for shipment. And I should know as I have experimented for the past 6 years with plants and getting them shipped from almost every state in the United States. R.E.G.

DISBUD EXHIBITION AND SPIDERY TYPES

SOIL PREPARATION. Chrysanthemums do best in a rich deeply cultivated soil. Incorporation of humus matters such as barnyard manure, decayed compost, peat moss, etc., is beneficial. In addition, superphosphate at the rate of 5 lbs. per 100 square feet is broadcasted and spaded to a depth of 12 to 15 inches early in the spring.

STOPPING. The center of the main growth is nipped off when about 6 inches tall and second stopping is generally required around end of June if planted early. Four to six lateral growths are allowed to rise from the last pinching.

DISBUDDING. All sub-lateral branches are removed at regular intervals of about 10 days apart. Many exhibition varieties will produce "First Crown Buds" or "Leaf Buds," as commonly known, in July which are usually removed and next buds retained.

SELECTION OF BUDS. The first bud produced is called the "Crown bud" and is distinguished by being surrounded with leaves. The "Terminal bud" appears later in clusters surrounded with flower buds. The procedure of "taking buds" depends very largely on the variety and no fast rule can be given.

FERTILIZING. About 3 applications of commercial fertilizer, such as "Vigoro," at the rate of 3 to 5 lbs. per 100 square feet would be sufficient. No feeding is done after the buds begin to show color.
